位置。侧缘不与肠支或其它生殖腺重叠。大小为0·127-0·172×0·095-0·134 (平均0·151×0·115)。卵黄腺位于腹吸盘之后,较接近卵巢及前睾而距腹吸盘较远。其距离

为0.070-0.146, 两卵黄腺外侧缘均超出腹吸盘外侧缘但不与肠支重叠。卵黄腺呈粗短的指状分枝, 先由基部引出主枝, 在主枝末端可再行分枝。左卵黄腺大小为0.109-0.172×0.083-0.127 (平均0.139×0.102); 右卵黄腺大小为0.089-0.159×0.070-0.146 (平均0.097×0.125)。卵模在两卵黄腺之间稍下方, 子宫充塞于腹吸盘之后, 肠支内外的空间。其末段上行, 越过腹吸盘背面, 在腹吸盘前缘的生殖腔内开孔。排泄囊为管状, 开口于虫体正末端。

虫卵较小,淡黄色,正圆形,大小为0.0255-0.0323×0.0204-0.0255(平均0.0287×0.0223)。

根据本种的形态特征,应列入发状科 (Gorgo_deridae) 叶形属 (Phyllodistomum) 内。与本种较为接近的 有P. acceptum Looss, 1901; P. cameroni Agrawas, 1966; P. undulans, Steen, 1938.但本种1.体表具乳突, 2.生殖孔在腹吸盘前缘。与体表光滑,生殖孔距腹吸盘较远而靠近肠叉分叉处的P. acceptum及P. cameroni明显不同。

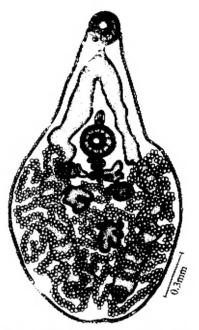

Fig. 1. Phyllodistomum saurogobio, sp. nov.

P• undulans体表虽具乳突,然其卵黄腺紧靠腹吸盘,腹吸盘显著大于口吸盘并与肠支重叠,睾丸浅分叶。本新种也不同于属内任何它种。

(School of Animal Husbandry and Fishery of Jiangxi Province)

The present paper reports three new species of genus *Phyllodistomum*, collected from the excretory bladder of fresh-water fishes in Nanchang, Xiushui, Congren of Jiangxi Province, China. Type specimens are kept in the Scool of Animal Husbandry and Fishery of Jiangxi Province.

1. Phyllodistomum saurogobio sp. nov.

This new species resembles P. acceptum Looss, 1901 and P. cameroni Agrawas, 1966, but differs from above two species in the features of the body, such as: 1) There are many papillae on the surface of the body; 2) Genital pore is situated at the frontal edge of the ventral sucker. This new species also differs from P. undulans Steen, 1938 in the following features: 1) There are definite distance from the acetabulum to the vitellaria; 2) Acetabulum is about equal to the oral sucker in size but does not over lapping the caeca;

3) Testes are deeply lobed.

Host: Saurogobio dabrye Bleeker.

Location: Nanchang.

2. Phyllodistomum leiocassis sp. nov.

This new species is similar to *P. lewisi* Srivastava, 1938 and can be distinguished easily from the following features: 1) The region of the anterior testis is the widest; 2) Testes are deeply lobed; 3) Eggs are larger. This new species also resembles *P. macrobrachiola* Yamaguti, 1934, but the former is distingushable from the latter in the following features: 1) The body is larger in size; 2) Testes are deeply lobed; 3) Ventral sucker is not over lapping the caeca. *P. singhiai* Gupta, 1951 is close to this new species but 1) The length of former's body is over 2.5 times as long as the width of the body; 2) Eggs are smaller.

Host: Leiocassis macrops Nichis.

Location: Xiushui: Fuzhou.

3. Phyllodistomum congrenensis sp. nov.

This new species resembles P. dogiei Piguleusky, 1953 and P. simile Nybelin, 1926, but differs from the latter in the following feature: 1) The acetabulum is about equal to oral sucker in size, 2) Acetabulum is over lapping the caeca; 3) Eggs are larger. This new species is also different from P. lewisi Strvastava, 1938 and P. singhiai Nybelin, 1926 in the following feature: 1) The back half of the body is nearly round; 2) Eggs are larger; 3) Testes are deeply lobed.

Host: Leiocassis partti (Gunther) and L. crassilaris (Dybowski). Location: Congren; Pinxiang.
